Application Design Equations

The bandwidth is determined by a factory programmable switched capacitor filter. The default setting is 100Hz. The filter can also be set at 2kHz, 1kHz, 500Hz, and 50Hz. Alternatively, bandwidth can be reduced by addition of a capacitor on the output pins 8, 9, and 10 according to the equation:

$$C_2 = C_3 = C_4 = \frac{4.97 \times 10^{-6}}{f_{BW}}$$

Note:

When the enable pin is connected to GND or left floating, the KXPC4 is in low power mode. When the enable pin is tied to V_{dd}, the unit is fully functional.
